Sentry Single Tenant Instance

Sentry is introducing Single Tenant instances.

The goal with our Single Tenant solution is to give you a SaaS like experience, except your resources and liabilities are not shared with other tenants. Your data is isolated. You get guaranteed uptime, support, and a fully managed solution by Sentry. Sentry will still maintain and automatically apply updates to keep your instance up to date and functioning, while your data at rest remains even more secure. It's perfect for those who are concerned about data isolation and/or geography.

Security

Data Isolation
Your single tenant instance's data does not share infrastructure and storage with anyone else's. It has its own unique encryption key. The 90-day data retention default is configurable upon request.

Geography
Choose a hosting region to comply with your legal requirements. Sentry can install onto any international region defined at Google Cloud: *https://cloud.google.com/about/locations/*

Maintenance & Updates

Sentry does the uptime, scale and performance. The updates will be shipped regularly for single tenant after they're deployed on SaaS.

Product Feature Set

The same features/functionality on sentry.io will be available on single tenant instances.

Support

Sentry's Support Engineers will help whenever you run into issues, big or small, and our Customer Success Managers can answer questions, collect feedback, and provide best practices and recommendations.
