# Discover by Sentry

## Analyze software health over time.

To get the right answer, you have to ask the right question. Enter Discover, Sentry's new query builder. It helps you analyze raw event data across your application.

For example, if you want to understand which parts of your code are responsible for triggering the most errors, use Discover to analyze everything from errors by release to slowest transactions by end user.
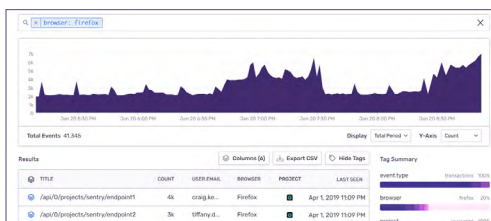

Prebuilt Queries

Discover gives you pre-built searches that help answer common questions about your events, unique errors, errors by URL, and client errors. You can also modify, save, or share pre-built searches. Tweak parameters and results without rewriting the query with the fully interactive query map.

Trace Trends

With Discover, you're able to explore whether multiple conditions contribute to an issue: does this only happen on Internet Explorer on Windows 10? Or does it affect all Windows 10 machines? Or all Internet Explorer users?

Build Custom Queries

Discover gives you the ability to build custom queries that are as unique as your data. Connect the health of your code to key business metrics, stay on top of how your code is trending, and receive real time alerts based on your custom queries.
