Stop observing, start debugging

Application monitoring software considered "not bad" by
4 million developers

ERROR MONITORING

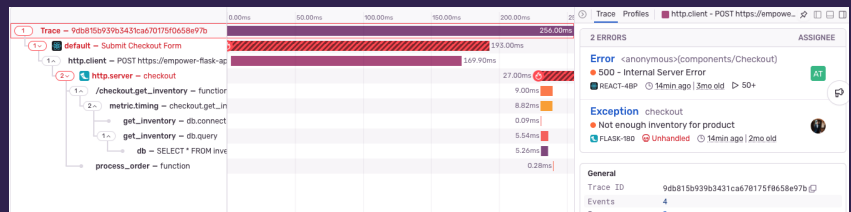

Identify, debug, and resolve

Know when your code breaks and who can help fix it. Then debug—across
any language or framework—with tailored context like the line of code,
user actions and functions leading up to when it occurred.

END-TO-END DISTRIBUTED TRACING

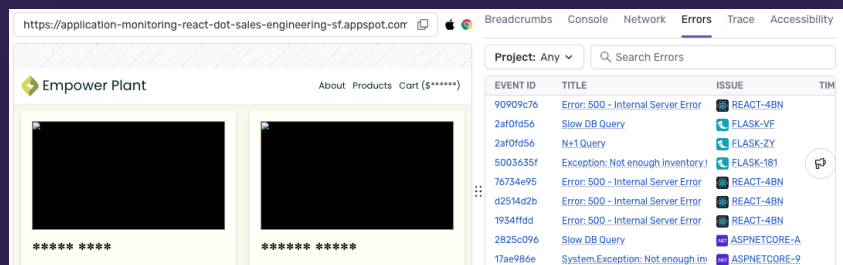

Find and fix problems no matter where they occur

Trace the complete, end-to-end path of a request to debug errors
and performance issues across your services—down to the specific
function, API call, or line of code causing the problem.

SESSION REPLAY AND USER FEEDBACK

See what your users are seeing to repro issues easier

Understand when, where, and how an error is impacting your app
with replays of real user sessions and User Feedback submissions—
giving visibility into known issues and bugs only your users can spot.

TEST COVERAGE WITH CODECOV

Get ahead of production issues

See the untested code causing errors - or whether it's partially or fully
covered - directly in your stack trace to avoid similar errors from
happening in the future.

The only developer-first application monitoring platform

Sentry's end-to-end distributed tracing enables developers to monitor performance and errors across services, identify bottlenecks, and optimize the user experience by pinpointing issues in real time.
